it'll add a page or two for each receptor for just the table of factors. I wasn't planning on explaining each non-epa one unless they ask.

Probably better to show all the assumptions – hope that won't be too long.

Thanks,

I've been out sick, but should get this thing wrapped up today. It's been a little trickier than I thought... a lot of cross-referencing.

To clarify: did you want me to include all the exposure assumptions for each different hypothetical exposure scenario. It may not be enough just to reference EPA's exposure factors handbook, because they used values from two different editions AND a few they

9493901

had to develop themselves. I could simply include tables of these things, but that would add volumn... could be an attachment.
